

Lecture Notes

Institute Name:	Silver Oak College of Computer Application		
Programme Name:	Integrated Master Of Science Information Technology	Semester:	7th
Course Code:	MDC5011C	Course Name:	Ethical and Legal Frameworks for Digital Systems
Unit No.:	3	Unit Name:	Intellectual Property Rights and Emerging Digital Technologies

1. Introduction to Intellectual Property Rights (IPR)

Intellectual Property Rights (IPR) are legal rights granted to individuals or organizations for creations of the mind. These creations may include inventions, literary and artistic works, software, designs, symbols, names, and technological innovations.

The main purpose of IPR is to **protect creators and innovators** while encouraging innovation, creativity, research, and commercialization.

Objectives of IPR

- Protect original creations and innovations.
- Provide legal ownership to creators.
- Prevent unauthorized use or copying.
- Encourage research and technological development.
- Provide economic benefits to creators.
- Promote fair competition.
- Support commercialization of intellectual creations.

Major Types of IPR

1. **Copyright**
2. **Patent**
3. **Trademark**
4. **Trade Secret**

2. Copyright

Copyright is a legal protection given to original literary, artistic, musical, cinematographic, and software works.

Copyright generally protects the **expression of an idea**, rather than the idea itself.

Examples

- Computer programs and source code
- Mobile applications
- Websites
- Books and articles
- Photographs
- Videos
- Music
- Digital illustrations
- Online courses
- Databases and digital content

Rights of Copyright Owner

The copyright owner generally has rights relating to:

- Reproduction
- Distribution
- Communication to the public
- Adaptation
- Translation
- Public performance
- Licensing

Example

Suppose a developer creates a Python-based student management application. Another person copies the application's source code and sells it without permission. This may constitute copyright infringement, subject to the applicable law and facts.

3. Patents

A **patent** is an exclusive legal right granted for an invention that satisfies applicable legal requirements.

A patent generally gives the patent holder the right to prevent others from commercially exploiting the patented invention for a specified period, subject to the relevant patent law.

Basic Patent Requirements

An invention generally needs to satisfy requirements such as:

- **Novelty** – it should be new.
- **Inventive step / non-obviousness** – it should not be an obvious modification.
- **Industrial applicability / utility** – it should have practical application.

Examples

- A new medical device
- A novel communication technology
- An innovative manufacturing process
- A new hardware architecture

Patent vs Copyright

Copyright	Patent
Protects original expression	Protects qualifying inventions
Commonly applies to software code, books, music, etc.	Applies to inventions satisfying patent requirements
Protection generally arises without registration, although registration may provide evidentiary advantages depending on jurisdiction	Requires patent application and examination
Protects expression, not merely an idea	Protects the claimed invention

4. Trademarks

A **trademark** is a sign capable of distinguishing the goods or services of one enterprise from those of others.

Examples

- Brand names
- Logos
- Symbols
- Product names

**SILVER OAK
UNIVERSITY**
EDUCATION TO INNOVATION

- Certain distinctive packaging or shapes
- Service marks

Importance

Trademarks:

- Protect brand identity.
- Help consumers identify products and services.
- Prevent confusingly similar branding.
- Build business reputation.
- Support customer trust.

Example

A company develops a unique logo for its cloud-computing platform. A competitor uses a confusingly similar logo for a similar service. Trademark law may provide protection depending on the circumstances.

5. Trade Secrets

A **trade secret** is valuable confidential business information that derives value from not being generally known and is protected through reasonable measures to maintain its secrecy.

Examples

- Source code kept confidential
- Machine-learning model parameters
- Algorithms
- Business strategies
- Customer lists
- Manufacturing processes
- Pricing strategies
- Proprietary datasets

Protection of Trade Secrets

Organizations should use:

- Access controls
- Authentication
- Encryption
- Non-disclosure agreements
- Employee confidentiality policies

- Data classification
- Monitoring and logging

Important Point

Unlike patents, trade secrets depend on **maintaining confidentiality**. If confidential information becomes publicly known, trade-secret protection may be lost depending on applicable law.

6. Software Piracy

Software piracy refers to unauthorized copying, distribution, installation, modification, or use of software in violation of applicable licensing or copyright conditions.

Common Forms

1. **Unauthorized copying** – copying licensed software.
2. **Counterfeiting** – distributing unauthorized copies as genuine software.
3. **License abuse** – using software beyond the permitted number of users/devices.
4. **Unauthorized sharing** – distributing software or license keys.
5. **Cracked software** – bypassing activation or licensing mechanisms.

Effects of Software Piracy

- Financial loss to developers
- Copyright infringement
- Security vulnerabilities
- Malware infection risks
- Loss of software support
- Reputational damage
- Legal consequences

Prevention

Organizations can use:

- Genuine licensed software
- Software asset management
- License monitoring
- Access control
- Digital rights management
- Employee awareness programs

7. Digital Content Protection

Digital content includes information distributed electronically.

Examples

- E-books
- Digital photographs
- Videos
- Music
- Software
- Online courses
- Research papers
- Digital artwork

Because digital content can be copied rapidly and distributed globally, protection mechanisms are important.

Protection Techniques

Digital Rights Management (DRM): Controls access and use of digital content.

Encryption: Converts content into an unreadable form that requires a key for access.

Watermarking: Embeds identifiable information into digital content.

Access Control: Restricts content to authorized users.

Authentication: Verifies user identity.

Licensing: Defines how content may legally be used.

8. Open Source Software and Licensing

Open Source Software (OSS) is software whose source code is made available under an open-source license that grants users specific rights to use, inspect, modify, and redistribute the software, subject to the license terms.

Open source does **not automatically mean "no copyright" or "no restrictions."**

Common Open-Source Licenses

- MIT License
- Apache License 2.0
- GNU General Public License (GPL)

- BSD licenses

Example

A developer downloads a library from GitHub and incorporates it into a commercial application. The developer must examine the library's license and comply with its requirements.

Key Licensing Concepts

Permissive License: Generally allows broad reuse with relatively limited conditions.

Copyleft License: May require derivative works to be distributed under the same or compatible licensing conditions.

Important Principle

Before using open-source software in a project, developers should check:

- License type
- Attribution requirements
- Redistribution conditions
- Modification requirements
- Patent provisions
- Compatibility with other licenses

9. Introduction to Artificial Intelligence

Artificial Intelligence (AI) refers to computational systems designed to perform tasks that typically require capabilities associated with human intelligence.

Examples include:

- Learning
- Reasoning
- Prediction
- Classification
- Natural language processing
- Computer vision
- Decision support
- Generative content creation

AI Technologies

- Machine Learning

- Deep Learning
- Natural Language Processing
- Computer Vision
- Generative AI
- Reinforcement Learning

Examples of AI Applications

- Chatbots
- Recommendation systems
- Fraud detection
- Medical diagnosis support
- Autonomous systems
- Face recognition
- Financial forecasting
- Social media recommendation

10. Ethical Use of AI Systems

AI systems can influence individuals, organizations, and society. Therefore, AI should be designed and deployed responsibly.

Major Principles of Responsible AI

Fairness: AI should avoid unjustified discrimination.

Transparency: Users should receive meaningful information about how AI systems operate where appropriate.

Accountability: Organizations should remain responsible for AI systems they develop or deploy.

Privacy: Personal information should be appropriately protected.

Safety and Security: AI systems should be robust and protected from misuse.

Human Oversight: Important decisions should have appropriate human involvement.

Reliability: AI systems should produce dependable results within their intended context.

11. AI Bias and Fairness

AI bias occurs when an AI system produces systematically unfair or prejudicial outcomes.

Bias can enter an AI system through:

- Training data
- Data collection methods
- Feature selection
- Historical social inequalities
- Labeling processes
- Model design
- Evaluation methods
- Deployment environment

Example

Suppose an AI recruitment system is trained using historical hiring data that contains gender imbalance. The model may learn historical patterns and produce systematically different recommendations for different groups.

Types of Bias

- **Data bias**
- **Sampling bias**
- **Historical bias**
- **Measurement bias**
- **Algorithmic bias**
- **Representation bias**

Reducing AI Bias

- Use representative datasets.
- Audit training data.
- Evaluate model performance across groups.
- Use fairness metrics.
- Conduct bias testing.
- Monitor models after deployment.
- Include human review for high-impact decisions.

12. Ethical Issues in Social Media Algorithms

Social media platforms use algorithms to determine what content users see.

These algorithms may consider:

- User interests
- Previous interactions
- Search history

- Likes and shares
- Watch time
- Social connections
- Location or other contextual information

Ethical Concerns

Filter Bubbles: Users may repeatedly receive content aligned with their existing interests.

Echo Chambers: Users may primarily encounter opinions similar to their own.

Misinformation: Algorithms can amplify misleading content when engagement-driven mechanisms reward it.

Addictive Design: Highly personalized recommendations may encourage excessive platform use.

Manipulation: Algorithmic systems can potentially influence user behavior.

Discrimination: Recommendation or advertising systems may produce unfair outcomes.

Lack of Transparency: Users may not understand why specific content is recommended.

13. Privacy Concerns in AI

AI systems often require large quantities of data. This creates significant privacy challenges.

Major Privacy Concerns

- Excessive data collection
- Unauthorized data usage
- Data leakage
- Re-identification
- Inadequate consent
- Surveillance
- Profiling
- Inference of sensitive information
- Third-party data sharing

Example

An AI application collects users' photographs for model training without clearly communicating the purpose or obtaining an appropriate legal basis or consent where required.

Privacy Protection Techniques

- Data minimization
- Anonymization
- Pseudonymization
- Encryption
- Access control
- Privacy-preserving machine learning
- Differential privacy
- Secure data storage
- Clear privacy policies

14. AI and Intellectual Property

The development and use of AI creates new IPR questions.

Important questions include:

- Who owns AI-generated content?
- Can copyrighted material be used to train AI models?
- Who owns the output of an AI system?
- Can AI-generated inventions receive patent protection?
- How should training datasets be licensed?
- How should creators be compensated?

The answers depend on the applicable jurisdiction, facts, contractual terms, and the specific technology involved.

Example

A generative AI system produces an image based on a user's prompt. Questions may arise concerning the user's rights, the AI provider's terms, underlying training data, and whether the resulting material qualifies for copyright protection.

15. Cloud Computing

Cloud computing provides computing resources such as servers, storage, databases, networking, and software through network-accessible services.

Major Cloud Service Models

IaaS – Infrastructure as a Service

Provides virtualized infrastructure such as:

- Virtual machines
- Storage
- Networking

PaaS – Platform as a Service

Provides a development and deployment environment.

SaaS – Software as a Service

Provides complete software applications through the internet.

Cloud Privacy and Security Concerns

- Unauthorized access
- Data breaches
- Misconfiguration
- Data residency
- Multi-tenancy
- Insider threats
- Insecure APIs
- Loss of control over infrastructure
- Compliance requirements

Protection Measures

- Strong authentication
- Encryption
- Identity and access management
- Security monitoring
- Backup and recovery
- Secure API design
- Least-privilege access
- Data classification

16. Internet of Things (IoT)

Internet of Things (IoT) refers to interconnected physical devices equipped with sensors, software, processing capabilities, and network connectivity.

Examples

- Smart watches
- Smart home appliances

- Industrial sensors
- Connected vehicles
- Smart meters
- Medical monitoring devices
- Smart cameras

IoT Security and Privacy Concerns

IoT devices can collect large amounts of personal and environmental data.

Major risks include:

- Weak passwords
- Insecure firmware
- Unpatched vulnerabilities
- Unauthorized access
- Data interception
- Device tracking
- Botnet attacks
- Insecure communication
- Excessive data collection

IoT Protection

- Strong authentication
- Secure firmware
- Regular updates
- Encryption
- Network segmentation
- Secure communication protocols
- Device access control
- Continuous monitoring

17. Relationship Between IPR, AI, Cloud and IoT

Modern digital technologies are interconnected.

AI requires data → **Cloud** provides scalable computing and storage → **IoT** generates large quantities of data → **IPR** protects software, inventions, brands and creative content → **Ethics and privacy** ensure responsible use.

Example: Smart Healthcare System

Consider an IoT-based healthcare system:

1. IoT sensors collect patient-related information.
2. Data is transferred to cloud infrastructure.
3. AI analyzes the collected data.
4. The organization protects its software and technology through appropriate IPR mechanisms.
5. Privacy controls protect personal information.
6. Ethical AI practices help reduce bias.
7. Security mechanisms protect the complete system.

18. Real-World Integrated Example

AI-Based Recruitment System

An organization develops an AI recruitment platform.

IPR:

The software code can receive copyright protection, while qualifying technical inventions may potentially be patentable.

Trade Secret:

Certain proprietary algorithms or model-development processes may be protected as confidential information.

Trademark:

The product name and logo can function as brand identifiers.

Privacy:

Applicant information must be handled according to applicable privacy and data-protection requirements.

AI Ethics:

The system should be evaluated for discriminatory outcomes.

Fairness:

Model performance should be assessed across relevant demographic groups.

Cloud:

Applicant data stored in cloud infrastructure must be appropriately secured.

Accountability:

The organization should maintain governance, monitoring, documentation, and human oversight appropriate to the system's impact.
